

Empirical Approach

Step 1: Comparable Measures from Both Sources

County-level migration rates (AGI, returns, exemptions) for IRS & ACS

Synthetic Difference-in-Differences (SDID)

One treated unit (Multnomah) | Donor pools: All, Urban (top 5%), Urban-Covid
With/without covariates | Excl. 2020

Specification Curves

Event Studies

Step 2: Source-Specific Analyses

IRS County-to-County Flows

Geographic patterns: where are people moving?

Descriptive Maps

Change in AGI flows to/from Multnomah

PPML Flow Models

Mijt with flow FE, time-varying controls (Equation 3)

Event Studies

Placebo Tests

ACS Individual-Level Data

Who is moving? Conditional on characteristics

Conditional Means

Migration rates by income, education, age

DiD Models

College educ. as proxy for treatment (Eq. 5)
Samples 1, 2, 3

Out-Migration

In-Migration

Step 3: Estimated Effects on Tax Revenues

Combine migration estimates with tax rate structure to quantify revenue impact

Outcome Variables:

- In-migration rate
- Out-migration rate
- Net in-migration rate

Key Controls:

- County & year fixed effects
- Per capita income, unemployment rate
- Median property tax (ACS counties)
- Covid-19 severity matching (donor pool)

Donor Pool Restrictions:

- Exclude AK, HI, CA, WA, OR
- All remaining counties
- Top 5% urban by population
- Urban + Covid-matched
